

Vault Messaging

OFFICIAL ROADMAP & CROWDFUNDING FRAMEWORK

Vault is a privacy-first, zero-telemetry anonymous messaging application built on top of E2EE protocols (X3DH and Double Ratchet). This document lays out the path towards introducing our native utility token, incentivizing decentralized relay nodes, and raising community crowdfunding with complete milestone-based transparency before launching the mainnet.

Phase 1: Foundation & Security Audits (Current)

Establish a secure, zero-PII messaging system with stable Double Ratchet, X3DH, WebRTC signaling, and encrypted offline local backups. Open-source the client and server codebases for initial peer review, closing identified bugs, and stabilizing Web Push compliance.

Phase 2: Community RFCs & Feedback Consolidation

Establish an open Request for Comments (RFC) protocol for design changes. Launch suggestion boards where community members can pitch features, critique design choices, and vote on community-requested capabilities (e.g., decentralized storage integration, multi-device sync, gasless wallet options).

Phase 3: Tokenomics Design & Crowdfunding Blueprint

Design the native Vault token utility and governance structure. The token will pay for decentralized relay bandwidth, TURN signaling, and metadata pinning. Draft whitepapers will be released in public Discord channels for community debate and revisions.

Phase 4: Testnet & Simulated Node Economy

Deploy a testnet for message relay nodes and simulated token payouts. Community members can spin up Vault relays using testnet tokens, stress-testing network latency, throughput, and node availability under load.

Phase 5: Mainnet & Decentralized Launch

Launch the live mainnet alongside the native token. Transition the Vault message relay system from centralized/semi-centralized architectures into a fully decentralized node network run by community members.

Transparent Crowdfunding Framework

To build absolute trust, crowdfunding will be managed through a milestone-locked treasury:

Stage	Description	Mechanism
-------	-------------	-----------

1. Proposal & RFC	Open-source proposal published for community review and debate.	14-day debate in `#tokenomics-rfc`
2. Multisig Escrow	Funds held in a multi-signature safe with community and team keys.	Gnosis Safe (e.g., on Arbitrum/Ethereum)
3. Milestone Releases	Funds released in tranches only when milestones are coded & verified.	Smart Contract Lock Escrows
4. Real-time Audit	Public dashboard tracking balance, expenses, and linked Git commits.	Vault App Audit Dashboard
